

Blue Nebula Applications Suite ReadMe

The **BN-Firmware-Recovery.exe** application can be used to repair/install the latest Firmware Version 5.xx into any Blue Nebula pedal that is either:

1. Currently suffering from corrupted firmware that is preventing the normal Firmware Updater from connecting, or,
2. Running an older Version 3.xx or Version 4.xx Firmware which is not compatible with the latest updater app.

If you are having problems getting the latest Firmware Updater to connect, try running the Firmware Recovery app. You will need to choose the correct Serial Port from the dropdown list, then click the **Update Pedal** button. In the following example, I know that my Blue Nebula is connected on COM4 – **yours may be different**.
